

Tushar Sharma

QA / SDET Engineer

tushar07988@gmail.com | +91 8219463907 | Bengaluru, India | [linkedin.com/in/tushar-sharma-b31959225](https://www.linkedin.com/in/tushar-sharma-b31959225) | github.com/TUSHAR7988

PROFESSIONAL SUMMARY

QA/SDET engineer who has built out QA functions from the ground up, with hands-on experience across CRM, mobile, web, API, and AI/LLM-driven system testing. Currently the first and only QA engineer at a multi-tenant CRM + AI-copilot platform (NestJS, Next.js, PostgreSQL, BullMQ), where I authored the QA test strategy and automation roadmap end-to-end, alongside a background in Android automation with Appium, Playwright-based automation systems, and conversational-AI/telephony validation. Proven ability to design scalable test strategies and automation frameworks from zero, structure module-by-module test cycles, and ensure quality across AI-powered CRM, voice, and business phone platforms. Adept at CI/CD integration, deep debugging, and Agile quality ownership.

PROFESSIONAL EXPERIENCE

QA / SDET Engineer | Lazulite Technology Services LLC

05/2026 – Present

Dubai, United Arab Emirates · Remote

- Lazulite's QA engineer; authored the company's foundational QA Test Plan (v1.0) from scratch, defining test strategy, scope, environments, severity/SLA definitions, and defect lifecycle for the CRM's transition to a multi-tenant commercial SaaS.
- Established the end-to-end QA process — shift-left requirement review, smoke/functional/regression test phases, a build-gate policy, and a standardized Jira bug-report template — as the team's first dedicated QA function.
- Defined the automation testing roadmap and tooling stack (Playwright for E2E, Vitest/Supertest for API validation, pytest for the Python-based Lumen AI agent, and direct SQL verification against a dedicated PostgreSQL test database), phased for rollout as the staging environment comes online.
- Designed a dedicated test approach for the platform's Lumen AI agent to handle LLM output non-determinism — contract/schema testing, guardrail checks, and fallback-behavior validation instead of exact-output assertions.
- Authored manual test scenarios across 9 concurrent feature releases spanning Products & Services, Deal Proposal Builder, English/Arabic RTL localization, BullMQ-driven bulk email marketing, and automated inactivity reminders.
- Completed end-to-end login and access verification across 73 company dashboards on the ADNOC Career Event Management System

Quality Assurance Engineer | Superfone

08/2024 – 05/2026

Bengaluru, India

- Owned end-to-end quality engineering for the Superfone AI Business Phone Dialer and CRM, covering telephony, CRM, AI call automation, and Android platforms.
- Designed and executed comprehensive test strategies for SIP-based call flows, validating inbound/outbound calls, call routing, session establishment, hold/transfer, and call teardown scenarios.
- Tested and validated FCM-based call notifications, ensuring reliable delivery across foreground and background states.
- Built and maintained Android automation test suites using Appium (Java + Selenium + TestNG) covering dialer, call handling, and Google Business Profile bulk WABA template send/review flows, achieving ~85% regression coverage.
- Set up automation testing for CRM features (lead creation, assignment, tagging, notes, call logs, contact lifecycle sync); led functional and edge-case testing of the AI Receptionist and AI Outgoing Sales Call Agent, covering intent recognition, LLM behavior, transfer/fallback logic, and call status transitions.
- Conducted API and backend validation using Charles Proxy and Firebase, and implemented JSON response validation for call events, CRM payloads, and AI conversation logs to ensure schema correctness and data consistency.
- Collaborated closely with product, backend, and AI teams during sprint planning, story grooming, and defect triage to ensure quality early in the SDLC.

KEY PROJECTS

CRM Test Automation Practice (Self-Directed) — Vitest · Supertest · Playwright · pytest · PostgreSQL

- Hands-on practice writing automated test suites (Vitest + Supertest, Playwright E2E) against CRM-style REST modules and UI flows, in parallel with defining the automation roadmap professionally at Lazulite.

- Writing SQL/PostgreSQL verification queries and practicing pytest-based patterns for Python/AI-agent style services to build automation depth ahead of staging rollout.

SofaScore Finished Match Monitoring System — Playwright · Python · Async · Concurrency · JSON

- Designed and developed an asynchronous Playwright-based monitoring system to detect football match completion within seconds.
- Implemented event polling and state validation logic to identify newly finished matches in near real-time.
- Built a semaphore-controlled concurrency model to safely manage multiple browser contexts with low CPU and RAM usage.
- Engineered the system for 24/7 fault-tolerant execution, handling network timeouts and session failures gracefully.
- Generated normalized JSON outputs per match for downstream validation and analytics.
- Optimized browser lifecycle handling to prevent memory leaks in long-running automation.

Door Service Provider Web Application (tscindo.com) — Freelance Project

- Developed a reusable Selenium automation framework (Java + TestNG) with POM structure and data-driven testing.
- Implemented test execution using testng.xml with assertions and parameterization.
- Integrated REST Assured for basic API automation validations.

EDUCATION

B.E. in Computer Science Engineering, Chitkara University, Punjab

2020 – 2024

CGPA: 9.39

High School, Him Academy Public School, HP

2019 – 2020

Percentage: 74%

TECHNICAL SKILLS

- Languages: Java, SQL, Shell scripting, JavaScript (basic), Python, OOPs concepts
- API Testing: Postman, REST Assured, JMeter, Supertest
- DevOps & VCS: Jenkins, Git, GitHub Actions
- Testing Types: Smoke, load testing, Functional, Cross-browser, sanity, Manual, Automation, Regression
- Frameworks/Tools: Selenium WebDriver, Appium, Playwright, TestNG, JUnit, Vitest, pytest, Maven, Jenkins, LangChain
- AI/LLM Testing: Conversational AI agent validation (intent recognition, fallback/transfer logic), contract & schema testing for non-deterministic LLM output, guardrail testing
- Mobile Tools: Android Studio, Appium Inspector, ADB, Firebase, Logcat
- Debugging Tools: Charles Proxy (Burp Suite), Chrome DevTools
- Domain/Platform exposure: Multi-tenant SaaS architectures, RBAC, BullMQ background jobs, PostgreSQL data verification
- Project Mgmt: Jira, Trello, Excel Issue Tracker
- Practices: Agile/Scrum, CI/CD, Page Object Model, Test Reporting

CERTIFICATIONS

- Introduction to Software Testing — Coursera
- Object Oriented Programming in Java — Chitkara University / Coding Ninjas
- Black-box and White-box Testing — Coursera
- Web and Mobile Testing with Selenium — Coursera

ACHIEVEMENTS & INTERESTS

- District-level Basketball Player with strong teamwork and competitive spirit
